SYSTEM AND METHOD FOR CONFIGURING INFORMATION HANDLING SYSTEM NETWORKED PERIPHERALS

Jonathan Vance

10 ABSTRACT OF THE DISCLOSURE

15

Information handling system peripherals, such as printers, scanners, routers, switches, are configured to communicate over a local area network with network configuration information stored on a portable flash memory device, such as a USB storage device. A network configuration utility associated with the peripheral applies selected network configuration information to the peripheral, such as a static IP address, a subnet mask and a gateway, and disables dynamic networking functions, such as DHCP, BOOTP and RARP to stabilize the peripheral configuration for communication over the local area network.
